

resume-forge Project Showcase

LLM-tailored resumes that clear ATS filters — with a mechanical no-fabrication guarantee.

Status: ● Complete

Date: July 2026

Project Lead: Vishal Poornima

1. The Big Picture

The Problem

ATS software rejects strong candidates for mechanical reasons — mismatched keywords, broken layouts — and manually re-tailoring for every posting does not scale.

The Solution

resume-forge parses a resume once, tailors it per posting, renders a one-page LaTeX PDF, and scores it locally — while a guard blocks any invented fact.

 **Key Impact Metric:** One-page, ATS-optimized resume scoring 80+/100 in ~70 seconds.

2. Core Features & Capabilities

- No-Fabrication Guarantee:** Every fact is matched to the verified resume — nothing is invented.
- Provider-Agnostic Inference:** Picks the best of 7 LLM backends — free cloud or fully offline.
- One-Page ATS-Safe Rendering:** Single-column PDF, scored by 6 deterministic ATS checks.

3. Technical Implementation

Layer	Technology Selection	Strategic Rationale
Frontend	React, Vite, Tailwind CSS	Animated progress UI, no framework overhead.
Backend / API	Python, FastAPI	Background jobs with live progress polling.
LLM Inference	Ollama + 6 free/paid cloud presets	Runs unmodified: \$0 budget to enterprise Claude.
Document Rendering	LaTeX (Tectonic), Jinja2	Deterministic, ATS-safe PDF typesetting.

4. Key Results & Visual Assets

Measurable Metrics

- Test Coverage:** 94 automated tests pass fully offline, enforced on every push via CI.
- Verified Performance:** ~70s per run on free inference vs. 1–3 min local; scores of 80–88/100 achieved.
